

## **ABSTRACT OF THE DISCLOSURE**

The present invention relates to fabric and textile conditioning compositions  
5 with improved particulate soil cleaning, containing particular combinations of  
cationic polymers and anionic surfactants in combination with a  
polyvinylpyrrolidone/amphiphilic carboxy containing polymer anti-redeposition  
system. The cationic polymers are preferably below a particular molecular weight to  
afford optimal cleaning and conditioning, and must be present in an effective  
10 amount to yield a substantial conditioning benefit. A method of conditioning articles  
using the inventive compositions is also disclosed.
